

1. Overview

Placement Portal v2 is a full-stack platform with a Flask backend, a Vue frontend, and Celery workers for asynchronous jobs.

2. Backend Highlights

- App factory pattern with modular blueprints.
- JWT-based role access for ADMIN, COMPANY, and STUDENT.
- SQLAlchemy data models for users, profiles, drives, and applications.
- Service layer for auth, admin workflows, company flows, and student flows.

3. Frontend Highlights

- Vue 3 single-page UI with role-specific dashboards.
- Authentication view and API abstraction for backend calls.
- Admin, company, and student workflows covered in dedicated components.

4. Background Processing & Infra

- Celery worker and beat scheduling for reminders/reports/exports.
- Redis used for queueing and cache support.
- Docker + docker-compose to run app and worker services locally.

5. Testing

- Smoke tests validate registration, login, profile setup, drive management, approvals, and applications.

6. Deliverables

- Source code for backend, frontend, jobs, and tests.
- Project documentation and run instructions.
- This PDF report committed to the repository for GitHub review.
